

Best way to setup a production VPS

Intro

After watching the new dream of code video about [Setting up a production ready VPS is a lot easier than I thought.](#) I wanted to try to replicate this for one of the server of my own. Maybe try to do it on one of the servers on my homelab. But for first experiment I think its best to try it out on a hetzner VPS. And before trying to host one of my own application I will be hosting the application he made called <https://github.com/dreamsofcode-io/guestbook>

Tech to work with

- Docker Install - [Docker install](#)
- Traefik - [Traefik Installation](#)
- Watch Tower to allow auto deploy with docker image updates - [Watch tower](#)
